Office 365 MFA User Setup

Summary: This article provides url for 2Factor,2FA,MFA,Microsoft,O365,Email,Prompt

<https://aka.ms/mfasetup>

Click Above

Sign in to your account

If multiple users use the email provided add more then one multiple factor authentication method
IE. Cell Phone for User1

Office Phone for User2

MultiFactor Authentication App like Authy, Microsoft Authenticator or other

Note: If using Authy or something besides Microsoft you have to click "Use Verification Code" then select the link Configure app without notifications

Microsoft

Additional security verification

Secure your account by adding phone verification to your password. [View video to know how to secure your account](#)

Step 1: How should we contact you?

Authentication phone ▼

United States (+1) ▼

Invalid phone number. Please provide a phone number in following format: 999 999 9999

Method

Send me a code by text message

Call me

Your phone numbers will only be used for account security. Standard telephone and SMS charges will apply.

Response to Compromised or Breach Email (in progress)

If a user has their email and/or password compromised, please follow the instructions below as quickly as possible to secure the account.

1. Reset User Password in the Office 365 admin page, [Admin Portal](#) Users>Active Users

David Mays

[Reset password](#)

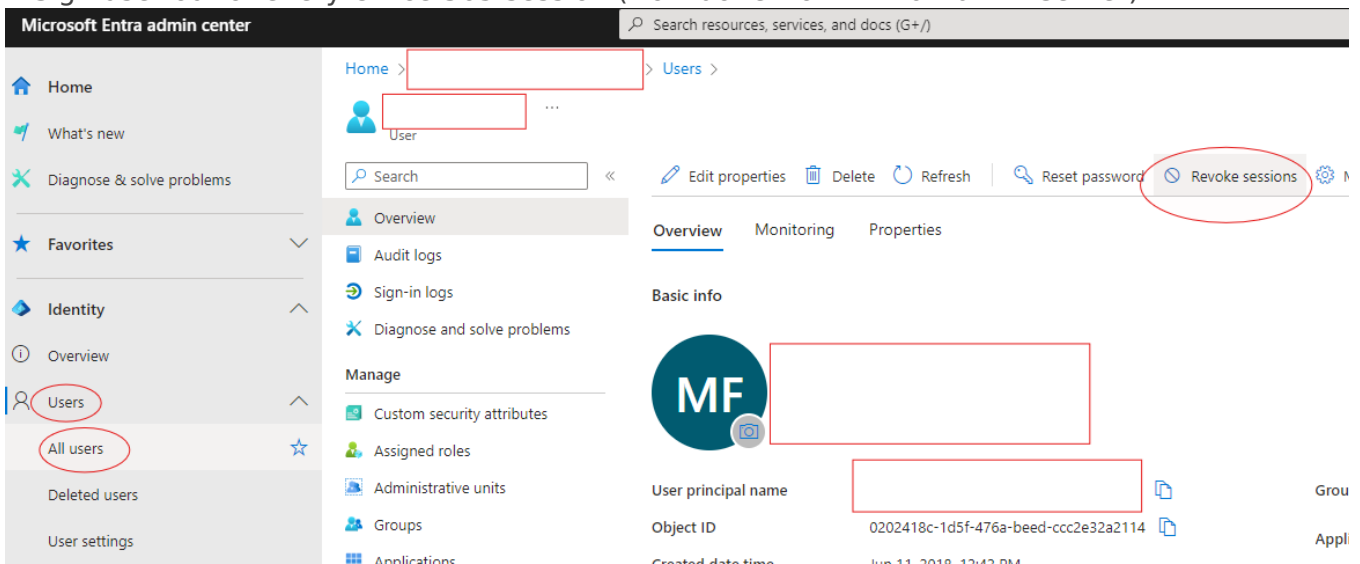

[Change photo](#)

[Account](#) [Devices](#) [Licenses and apps](#) [Mail](#) [OneDrive](#)

Created date time Jun 11, 2018, 12:42 PM

3. Setup MFA

4. Reset MFA if it was already setup (Do this through Endpoint Manager)

If endpoint manager is not available through 365 admin, going incognito and signing into entra.microsoft.com will bring you to the area below as well

Authentication methods are the ways your users sign into Azure AD. Here, you can set the phone numbers and email addresses that users use to perform multi-factor authentication and self-service password reset, and reset a user's password.

Alternate phone

Email

Alternate email is now managed on the [Profile](#) page

5. Look at sign in logs and take note of irregular locations. Export data and format into a neat excel workbook and name it "Summary of Breach for [user's name]". We want to make this a report that the user's manager can document since banks (or some vendors) will require some of this info and action plans from our clients to restore access.

6. Look in Outlook OWA (or access individual mailbox through exchange admin center) for any odd rules redirecting emails or deleting emails.

7. In Exchange Admin Center, pull a message trace for any email sent by that user for a timeframe that covers the whole breach. Export those results into a second page in the excel workbook that you started and format it with relevant columns and make it easy for the user to read.

8. Look for any Registered devices in Azure that aren't good devices

9. If user is a Global Admin go to next section

10. Send an email to the relevant manager of that user with the user CC'd with a small summary of what kind of compromise it was (session highjack/user provided access, or something else?) and attach the summary workbook. That will give them the info of when the bad guy got access and what emails they were able to send and to whom. I am attaching an example email to this documentation with sensitive data removed but will show what the client should see.

11. If you're fully satisfied that the account is secured again, remove the user from "Restricted Entities" if they're still there: <https://security.microsoft.com/restrictedusers>

Was the User a Global Admin?

1. Verify if the user needs to be a Global Admin
2. Remove all unnecessary Global Admins
3. Look for any outbound connectors in Exchange that don't belong
4. Look for any rules in Exchange that don't belong
5. Verify all users have MFA enabled

There is also this company that specializes in digital investigations and stuff, called Asceris. I am putting their name down here as a potential partner in the future

<https://www.asceris.com/bec> if clients ever need a investigation specialist type service that is more indepth than our own stuff (I don't even know if they're more in-depth yet)

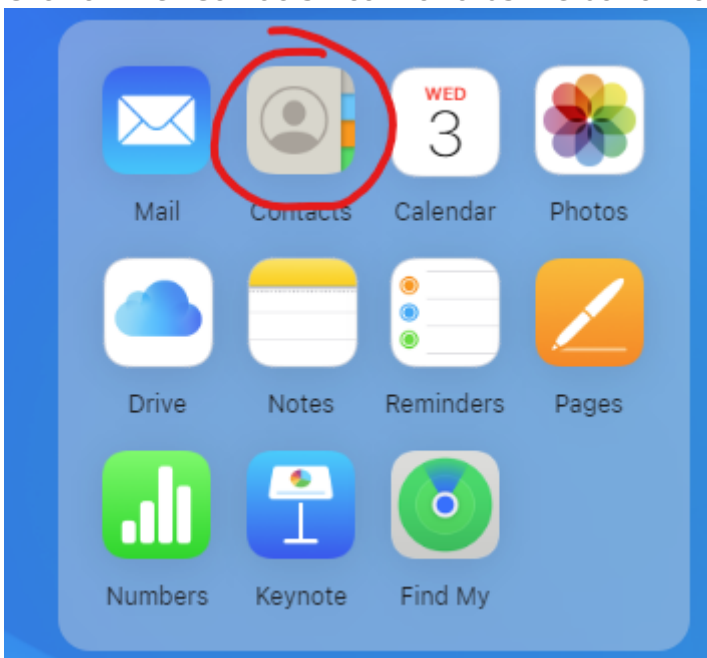

Bulk Contact migration on iPhones

Problem:

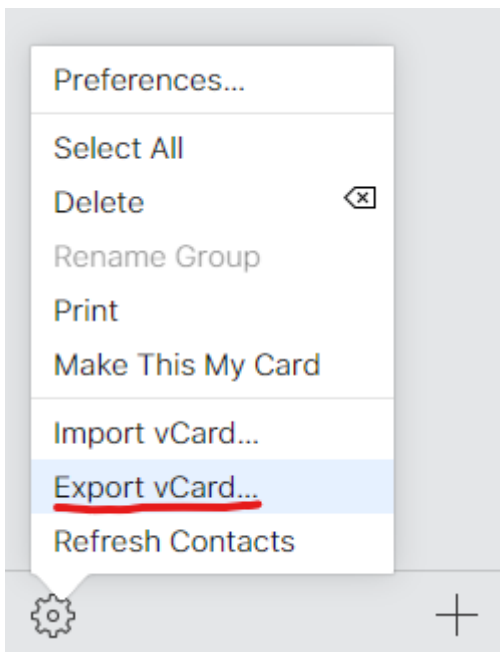

Apple iPhone's do not have a built in bulk contact export function programmed into them. Rather they expect that you can share 1 contact at a time, or that you would log into another iPhone with your iCloud account if you needed all of your contacts. However, there is a way to get a single vCard file that contains any or all of your contacts. Please follow the instructions below for this process. As always, please reach out if further assistance is needed, thank you!

Resolution:

1. Ensure that your current (old) iPhone has its contacts synced to your iCloud account
You can check this by going to Settings > click on your name at the top > iCloud > Show All and then make sure "Contacts" is switched on
2. Go to <https://icloud.com> and login to your iCloud account
3. Click on the "Contacts" icon towards the bottom of the page

4. Select all of the contacts that you would like to move over to the new phone. You can do this by holding "Ctrl" and selecting multiple contacts, or by holding Shift and selecting the last contact to highlight ALL contacts.
5. On the bottom left of the screen, click on the gear icon and then select "Export vCard..."

6. The file that downloads can then be emailed to the new phone (or anyone else) and opened. At that point, the iPhone will ask if you'd like to import all of the contacts in the file.

This will allow you to move any number of contacts from one iPhone to another without a shared iCloud account. Have a wonderful day!
